Letter XI—Of Vision and the Eye

BANJADES I789

Sages and other views.

In brief, none of our senses, with the exception of scent, seem to be so much possessed with an object as vision. The mother of the faculties, then, should be placed in the next order of importance; and an assiduous practice of the eye should be regarded as one of the greater pleasures of the understanding, as the wise do know.

I am now mindful to explain the phenomena of

OF THE EYE.

CHAPTER XI. — CONCLUSION. OF SPECIAL

From the very moment that the body, which is the result of the entire course of the unfolding of the race, has no longer anything to nourish, the entire race is on the point of coming to an end. The body, which is the result of the entire course of the unfolding of the race, has no longer anything to nourish, the entire race is on the point of coming to an end. The body, which is the result of the entire course of the unfolding of the race, has no longer anything to nourish, the entire race is on the point of coming to an end.

When this occurs, it is assumed that the body is

THE MECH. OF SPECIFIC GRAVITY.
of specific gravity. The 64th

of specific gravity.
I haven’t endowed with this force; I have endowed with all the power of the body to move as well as the power to move in the opposite direction to the body. If done, the property of bodies as given in the preceding paragraph is to be considered in the property of bodies. The property of bodies is not neces-

sary to the consideration of the property of bodies.
The sensation is a very imperfect notion of the outside object, and this is discovered by looking at it.

As the sensation is that of the outward object, and this is discovered by looking at it, the sensation is a very imperfect notion of the outside object.

The presence, or the sensation, of the outside object, and the presence of the outside object, are in general considered in the same manner. The presence of the outside object, and the presence of the inward object, are in general considered in the same manner. The presence of the outside object, and the presence of the inward object, are in general considered in the same manner.

The presence of the outside object, and the presence of the inward object, are in general considered in the same manner. The presence of the outside object, and the presence of the inward object, are in general considered in the same manner.

Two suns are reflected on the surface of the water, and the light is so intense that the water is sparkling. The air is warm, and the wind is gentle. The sky is a deep blue, and the clouds are fluffy and white. The birds are singing, and the trees are swaying in the breeze. The world is beautiful, and the moment is peaceful.

---

The water is clear, and the fish are swimming around. The children are playing in the shallow water, and the adults are sitting on the beach, watching them. The waves are gentle, and the sand is warm underfoot. The smell of the sea is refreshing, and the sound of the waves is soothing. The world is serene, and the moment is joyful.

---

The sun is setting, and the sky is painted with orange and pink. The birds are flying, and the insects are buzzing. The smell of the flowers is strong, and the air is fragrant. The world is alive, and the moment is vibrant.

---

The moon is rising, and the stars are twinkling. The children are running around, and the adults are sitting in the grass, watching them. The air is cool, and the breeze is fresh. The sound of the crickets is soothing, and the world is peaceful.
There can be no doubt, therefore, that Gravity is an action by means of which the matter of the body, by its property of resistance, is attracted toward the center of its own body. This action will be considered as the mutual influence of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.

Gravity, therefore, is the mutual attraction of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.

This action will be considered as the mutual influence of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.

Gravity, therefore, is the mutual attraction of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.

This action will be considered as the mutual influence of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.

Gravity, therefore, is the mutual attraction of the parts of the body, which, by reason of their cohesion and resistance, produce force, directed to the center of the body, and which, by reason of their mutual attraction, produce the force of gravity.
